

Components of a raspberry pi

1. Bluetooth connection: Allows the pi to be able to communicate with devices like speakers or phones without the need for too many USB cables.
2. CPU: Central processing unit, acts as the brain of the pi and processes all calculations, user programs, and controls the flow of information into memory.
3. RAM: Random access memory, stores short-term memory that the CPU can process
4. GPIO: General Purpose input and output, receives all inputs and sends them to be processed, then returns back the output from the CPU.
5. Gigabit ethernet: In charge of maintaining a strong network connection and reduces any network issues.
6. USB 3.0: Allows data transfer from storage devices like thumb drives.
7. USB 2.0: Connects to wired devices like keyboards and mice and can collect inputs from them.
8. Audio port: Controls audio outputs into wired headphones or speakers.
9. Micro HDMI ports: Allows for connections into monitors via HDMI cables
10. USB - C power port: Supplies the pi with power when plugged in
11. Micro SD card slot: SD card is where long-term storage is found, and can be removed and transferred to other pi's.
